

Snapshot®

Nursery

Ornamental

SPECIALTY HERBICIDE

Time is money. For nursery operators, landscapers and other turf and ornamental professionals, time spent on hand weeding is simply time taken from other important tasks.

Free up some of that valuable time with Snapshot® specialty herbicide. Snapshot delivers season-long control of more broadleaf and grassy weeds than any other preemergence herbicide. Snapshot works around the clock for up to six to eight months to keep landscapes and container- and field-grown nursery ornamentals weed-free. Snapshot has been tested on hundreds of ornamental plants and grasses and has been proven to offer exceptional plant tolerance.

How Snapshot Specialty Herbicide Works

As the weed seeds germinate, Snapshot specialty herbicide disrupts their development. Seedlings gradually die before they ever break the soil surface. Snapshot should be activated by at least ½ inch of rainfall or irrigation to set up a solid control area around weed seedlings. It bonds tightly with soil particles and is low in water solubility, so it won't move out of the application zone.

Rainfall or irrigation should occur within three days after application of Snapshot for optimum results.

Weeds Controlled

Research shows that effective weed control can increase ornamental growth by 50 percent or more. Snapshot controls or suppresses more than 125 broadleaf weeds and annual grasses, including:

- Barnyardgrass
- Bittercress
- Common chickweed
- Foxtail
- Goosegrass
- Groundsel
- Maretail
- Oxalis
- Ragweed
- Spurge

Nursery Recommendations

Snapshot demonstrates exceptional plant tolerance by established plants. Snapshot specialty herbicide can be used over the top of 636 field-grown and 487 container grown ornamentals — see product label for details.

Landscape Recommendations

Snapshot provides broad-spectrum preemergence control of both grassy and broadleaf weeds in landscape beds for months, eliminating the need for tedious hand weeding. It can be applied over the top of more than 635 established ornamentals, perennials, ground covers and ornamental grasses.

Active Ingredients

Snapshot® specialty herbicide contains the active ingredients isoxaben and trifluralin. Together, they provide excellent plant tolerance and long-lasting, broad-spectrum pre-emergence weed control.

Snapshot is available in two easy-to-use granular formulations — Snapshot 2.5 TG and Snapshot DG specialty herbicides. Available in convenient 25-pound bags, Snapshot DG utilizes The Andersons patented DG Lite formulation, which features a dispersible granule.

How to Apply

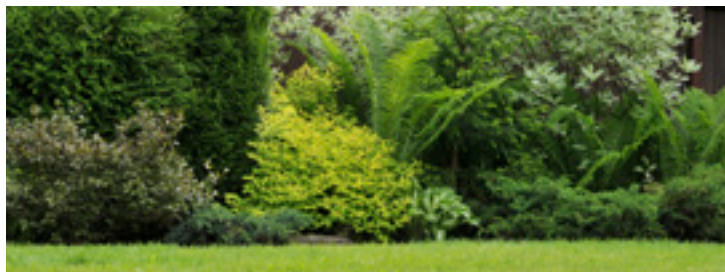

Apply Snapshot in early spring prior to germination of target weeds, in late summer to early fall, or any time immediately after cultivation. Following application, monitor weed control over time to determine if additional applications may be needed.

Depending on the weeds to be controlled, apply the labeled rate of 2.3 to 4.6 pounds per 1,000 square feet by using a rotary spreader. Calibrate application equipment prior to use according to the manufacturer's directions. Check frequently to be sure equipment is working properly and distributing granules uniformly. More uniform application can be achieved by spreading half of the required amount of product over the area and then applying the remaining half in swaths at right angles to the first application.

Application Precautions

- Snapshot does not control established weeds. Apply prior to weed seed germination. Control existing weeds by cultivation or with a postemergence herbicide.
- Weed residues, prunings and debris should be removed or thoroughly mixed into soil prior to treatment.
- Repeat applications at the rate of 150 pounds per acre and higher should not be made within 60 days of original application. Do not apply more than 600 pounds per acre within a 12-month period.

- Do not apply Snapshot to:
 - Newly transplanted ornamentals (until soil has been settled by packing and irrigation or rainfall)
 - Un-rooted liners or cuttings that have been planted in pots for the first time
 - Pots less than 4 inches wide

Key Benefits

- **It works.** Snapshot specialty herbicide provides unsurpassed control of grassy and broadleaf weeds.
- **It offers long residual.** Depending on factors such as weeds controlled and application rate, Snapshot provides up to six to eight months of control.
- **It saves time and money.** It saves landscape and nursery professionals thousands of dollars in hand weeding labor costs.
- **It offers excellent plant tolerance.** Snapshot can be applied over the top of more than 635 labeled ornamentals.
- **It stays put.** Once activated, Snapshot remains in the weed seed germination zone.
