## ACTIVE INGREDIENTS

### BROMACIL

A residual herbicide which acts as a soil sterilant to prevent vegetation growth for an extended period of time. Works slowly as it is carried to the root zone through moisture and absorption.

### 2,4-D/2,4-D SALTS

Mimics the action of a growth hormone within the plant. It stimulates unusually rapid growth which strains the life support system of the plant to a point where death occurs.

### PROMETON

Works through root and foliage absorption for a thorough kill. This photosynthesis-inhibiting herbicide acts as a soil sterilant to control regrowth and new seedlings.

### DIQUAT DIBROMIDE

When absorbed, it disrupts the photosynthesis process and kills the unwanted plant. This contact herbicide eliminates surface vegetation so replanting can occur soon after application. Deactivates upon contact with the soil.

### MCP/2,4-DP

A group of systemic herbicides designed to kill specific broadleaf weeds. Once absorbed into the plant, they kill by disrupting important metabolic processes within.

### GLYPHOSATE

Enters the metabolism of the weed and inhibits its growth. Systemic action kills the entire plant. Becomes inactive upon contact with the soil.
